SUMMARY

Data Analyst with 1.5+ years of experience in operations analytics and BI, with hands-on experience building Python-based data pipelines, machine learning workflows, time-series forecasting, and Generative AI applications. Built and deployed an AI-powered BI platform combining ARIMA forecasting, customer segmentation, RAG, vector search, and an LLM business advisor.

EXPERIENCE

EVERISE (VIA TIBIL SOLUTIONS)

(January 2025- present)

Data Analyst

- Track real-time SLA, shrinkage, and agent occupancy; publish daily Power BI dashboards for management.
- Automated ETL pipeline using Python (Pandas) + Excel Macros, cutting reporting time by 30%.
- Write complex SQL queries (Window Functions, CTEs) for root-cause analysis on metric dips.

ONCABS

(2024)

Web & Analytics Manager

- Tracked user behavior via Google Analytics; built weekly Excel dashboards for marketing.

EDUCATION

Islamic University of Science & Tech (2024 - 2026)

7.5

Master of Computer Applications

Islamia College of Science and Commerce (2020 - 2023)

7.45

Bachelor of Computer Applications

SKILLS

BI & Viz:

Power BI (DAX, Power Query), Advanced Excel (Macros, Pivot Tables)

DB & Code:

SQL (Joins, Window Functions, CTEs), Python (Pandas, Matplotlib)

AI/ML:

ARIMA, K-Means, RFM, RAG (Groq/Pinecone)

Cloud:

Vercel, Railway, MongoDB Atlas

PROJECTS

TR-INSIGHTFORGE - BUSINESS INTELLIGENCE PLATFORM

- Built an AI-powered analytics platform enabling non-technical users to upload business data and receive automated revenue forecasts, customer segmentation, and strategic recommendations.
- Developed ARIMA forecasting with automated parameter tuning, achieving ~5% MAPE, with fallback logic for limited historical data.
- Implemented RFM + K-Means segmentation to identify Champions, Loyal, At-Risk, and Needs Attention customers with automated retention strategies.
- Built a RAG-based AI Business Advisor using Pinecone and Llama 3.3-70B via Groq, providing natural-language insights grounded in business data.
- Tech Stack: React (Vite/Tailwind) | FastAPI | MongoDB Atlas | Pinecone | Groq

CUSTOMER CHURN EARLY-WARNING SYSTEM

- Python | SQL | Power BI | Scikit-learn | Git
- Built an end-to-end churn prediction system for 7,043 customers, combining SQL feature engineering, Python EDA/ML, and Power BI reporting to identify customers at risk of leaving.
- Trained a Random Forest classifier achieving ~89% recall and 0.86 ROC-AUC, prioritizing detection of high-risk customers for retention campaigns.
- Identified 1,687 high-risk customers (24% of base) and quantified approximately ₹1.27L in monthly revenue at risk, translating model outputs into actionable business KPIs.
- Developed a Power BI dashboard covering churn drivers, customer risk segmentation, revenue exposure, and retention action lists to support proactive customer retention.

POWER BI DASHBOARDS

- Kashmir Tourism: Analyzed district-wise tourist footfall and seasonal patterns across J&K. Identified peak seasons and underperforming districts, providing actionable recommendations to boost off-season tourism via targeted marketing campaigns for "hidden gem" destinations.
- Walmart Sales: Tracked MoM growth, regional profit margins, and category performance using advanced DAX with drill-through for store-level analysis.
